Balcony 1 System, handrail in white
BALUSTRADE LOADS:

The balustrade is designed to resist the horizontal imposed loads specified in Table 4 of BS 6399-1:1996 (see below), covering occupancy classes A(i) and (ii), B(iii), (iv) and (v), C3(viii) and (ix), and (iii), (iv) and (iii).

Handrail: The handrail is designed for a uniformly distributed horizontal imposed line load of 0.74 kN/m (164 pounds per metre approximately).

Glass infill: The glass infill is designed for a uniformly distributed load of 1.0 kN/m² (220 pounds per square metre approximately) plus a point load of 0.5 kN (110 pounds approximately).

Table 4
Minimum horizontal imposed loads for parapets, barriers and balustrades, etc.

[A1] Not deleted
VERTICAL LOADS:
As specified in Clause 10 of BS 6399-1:1996, the handrail is also designed for a vertical uniformly distributed load of 0.60 kN/m or a concentrated load of 1.0 kN, whichever gives the worst design condition in combination with the horizontal loading in Table 4.

Vertical loads are transmitted direct to the balcony structure through the 10mm thick thermally toughened safety glass. The concentrated load of 1.0 kN is spread by the handrail. The maximum compressive stress on the glass is 600 / 10 x 1000 = 0.06 N/mm² which is low and well within allowable values provided by the glass manufacturer.

ALUMINIUM PROPERTIES:
Material type = Extruded aluminium type 6063 T5

Limiting stress for bending and overall yielding = \( P_o = 110 \text{ N/mm}^2 \) (Table 4.1)

Limiting stress for tension or compression = \( P_s = 130 \text{ N/mm}^2 \) (Table 4.1)

Limiting stress for shear = \( P_v = 65 \text{ N/mm}^2 \) (Table 4.1)

Factored resistance = Calculated member capacity based upon the limiting stresses \( P_o \), \( P_s \) & \( P_v \) divided by the material factor \( \gamma_m \)

Material factor = \( \gamma_m = 1.20 \)

FACTORED LOADS:
Factored loads are used for checking the limit state of static strength of a member.

The imposed loads tabulated on Page 3 are known as ‘service loads’. These loads are multiplied by a load factor \( \gamma \) of 1.33 (Table 3.1) to give ‘limit state’ design loads that are used in relation to the factored resistance capacity of a member.

DEFLECTION:
All structural members deflect to some extent under load.

For balustrade handrails the deflection is limited to 25mm under service load conditions.
BALUSTRADES - Balcony 1 System handrail without internal steel reinforcing bar

Dimensions in mm

Young's modulus of elasticity (aluminium)  =  \( E_a \)

\[ = 70000 \text{ N/mm}^2 \]

Moment of inertia about the y-y axis  =  \( I_{yy} \)

\[ = 47 \text{ cm}^4 \]

Least section modulus about the y-y axis  =  \( Z_{yy} \)

\[ = \frac{47}{3.844} \]

\[ = 12.227 \text{ cm}^3 \]
BALUSTRADES - Balcony 1 System handrail without internal steel reinforcing bar

Moment capacity of handrail for horizontal loads

\[
(\text{Po}) \times \frac{Z_{yy}}{(Y_m)} = \frac{110 \text{ N/mm}^2 \times 12.227 \text{ cm}^3 \times (10)^3}{1.2} = 1.12 \text{ kNm}
\]

Applied design load (ultimate limit state)

\[
= 0.74 \times 1.33 = 0.984 \text{ kN/m}
\]

Horizontal moment on handrail

\[
= \frac{w L^2}{8}
\]

The handrail is restrained in the vertical direction by the toughened glass.

Allowable span L between points of support based upon the moment capacity of the handrail

\[
L = (8 \times \frac{M}{w})^{0.5} = (8 \times 1.12)^{0.5} (0.984) = 3.0 \text{ m}
\]

Service load deflection based upon a span of 3m

\[
= \frac{5 w L^4}{384 E I} = \frac{5 (740 \times 3.0) (3000)^3}{384 \times 70000 \times 47 \times (10)^4} = 23.72 \text{mm} < 25 \text{mm} = \text{OK}
\]
BALUSTRADES - Balcony 1 system handrail without internal steel reinforcing bar

On longer balconies, posts are installed at a maximum spacing of 1.9 m.

Wall fixings

The wall fixing consists of stainless steel angles bolted to the wall using 2 No. stainless steel resin anchor bolts and connected to the handrail using 2 No. stainless steel Phillips screws.

For the maximum allowable span of the handrail of 3.0 m between points of support, the horizontal load on each wall fixing is:

| working load on wall fixing | 0.74 x 1.5 | 1.11 kN |
|                            |            | 0.555 kN/bolt |

The horizontal load on the handrail is assumed to be applied to the fixing angles at the location of the Phillips screws, which are set 32 mm from the back of the angle. The wall fixing bolts are 27.5 mm apart. The resulting working load direct tension (pull-out) force on the bolts is:

| working load pull-out force | 1.11 x 32 / 27.5 | 1.29 kN |

11. 8mm Chemfix stud or similar
BALUSTRADES – Balcony 1 System handrail without internal reinforcing bar

SUMMARY

1. On single span or corner balconies, the handrail is capable of supporting the design factored loads over spans up to 3.0 metres between points of support. (ie. a handrail wall fixing, or a handrail corner joint).

2. On longer balconies where the length of the balustrade exceeds 3.0 metres, vertical posts are installed at a maximum spacing of 1.9 metres. The posts are 48.3mm diameter x 5mm thick steel structural hollow sections sheathed in aluminium.

3. For the maximum spacing between the centres of posts of 1.9 metres the working load pull-out force on each of the bolts on the post base plate is 12.89 kN.

4. For the maximum allowable span of 3.0 metres on single span and corner balconies, the horizontal working load shear force on each of the handrail wall fixing bolts is 0.555 kN. The co-existing working load pull-out force on each bolt is 1.29 kN.

5. The installers should satisfy themselves that the fixing bolts chosen are suitable to resist these loads, and also that the structure into which they are installed can support these loads.

6. The toughened glass panels were test loaded by an independent testing laboratory (Sandberg Consulting Engineers – report reference 26890/M) and found to be adequate to withstand the design factored loads specified in relevant British Standards.
